SANDBOX NOTES – For Organization SA

1. Anyone using TDDT **MUST** log in to the Soldier Portal on appropriate server first.   For the sandbox, address is: http://sandbox.train.army.mil/portal

2. If you get an error message, try again. Often the second try works. If that doesn't work, please let Melody Jones know what errors you encounter. Please send to email: jonesm@atsc.army.mil, or phone: 757-878-4468, ext. 7103

3. A User **must** have a role assigned before they will be able to get in to TDDT at all.

   -When SA, who is trying to assign roles, filters User document by Security Domain and user does not appear in resulting list, select the Get All button and find user in the list of all users.   When data was migrated if users were in more than one database they came over in the first database migrated, not necessarily the home

4. User **must** have correct Role, and **must** be in an access group that is linked to the subdomain that holds the objects user is trying to access.

   - Not all groups migrated over with links intact. Subdomains (ASAT user groups)   seem to be fairly complete, so the failed link is usually in the access group.

      ** Open the task user is trying to access and then open Data Tree Viewer   (12th icon over on the toolbar.)

      ** Open the Security Subdomain folder.

      ** Open the Access Group Permission and you will be able to then open the   other folders to determine what access group is connected to that   subdomain, which users are in that access group, what permissions they   have, etc.

   - If there is no Access Group Permission for that subdomain the SA will have
to create a new one.

   - If there is an Access Group Permission but it isn't correct or complete,
